### Description

The FOD8383 is a 2.5 A output current gate drive optocoupler capable of driving medium-power IGBT/MOSFETs. It is ideally suited for fast-switching driving of power IGBT and MOSFET used in motor-control inverter applications and high-performance power systems.

The FOD8383 utilizes Fairchild's Optoplanar<sup>®</sup> coplanar packaging technology and optimized IC design to achieve reliable high-insulation voltage and high-noise immunity.

It consists of an Aluminum Gallium Arsenide (AlGaAs) Light-Emitting Diode (LED) optically coupled to an integrated circuit with a high-speed driver for push-pull MOSFET output stage. The device is housed in a wide body, 5-pin, small-outline, plastic package.

### Notes:

9. Propagation delay  $t_{PHL}$  is measured from the 50% level on the falling edge of the input pulse to the 50% level of the falling edge of the  $V_O$  signal.
10. Propagation delay  $t_{PLH}$  is measured from the 50% level on the rising edge of the input pulse to the 50% level of the rising edge of the  $V_O$  signal.
11. PWD is defined as  $|t_{PHL} - t_{PLH}|$  for any given device.
12. The difference between  $t_{PHL}$  and  $t_{PLH}$  between any two FOD8383 parts under the same operating conditions, with equal loads.
13. Common mode transient immunity at output high is the maximum tolerable negative  $dV_{cm}/dt$  on the trailing edge of the common mode impulse signal,  $V_{CM}$ , to ensure that the output remains high (i.e.,  $V_O > 15.0\text{ V}$ ).
14. Common mode transient immunity at output low is the maximum tolerable positive  $dV_{cm}/dt$  on the leading edge of the common pulse signal,  $V_{CM}$ , to ensure that the output remains low (i.e.,  $V_O < 1.0\text{ V}$ ).
